

# GitLab User Documentation

Welcome on UNIGE's GitLab documentation. You will find here all the information you need to use the UNIGE's GitLab instance.

See <https://gitlab.unige.ch/help/user/index.md> if you are looking for the upstream documentation of the UNIGE GitLab running instance.

## Access

`gitlab.unige.ch` is open to the whole Swiss educational audience via [SWITCHaai](#) (UNIGE members should use their ISIs credentials) and to any non-academic entity via [SWITCH edu-ID \(free registration required\)](#) . For this reason, password authentication have been deactivated.

## SSH

Git `clone/push/pull` are available:

1. via SSH (see <https://gitlab.unige.ch/help/ssh/README.md> ) after either the user has added a key in the GitLab profile settings or one of the project administrators has set up a **Deploy Key** in the GitLab project interface
2. via HTTPS after the user has generated a **Personal Access Token** in the GitLab profile settings (see [https://gitlab.unige.ch/help/user/profile/personal\\_access\\_tokens.md](https://gitlab.unige.ch/help/user/profile/personal_access_tokens.md) ) or one of the project administrators has set up a **Deploy Token** in the GitLab project interface (see [https://gitlab.unige.ch/help/user/project/deploy\\_tokens/index.md](https://gitlab.unige.ch/help/user/project/deploy_tokens/index.md) )

## Permissions

Access to each resource is directly managed **per (sub)group or project** via the web interface (see <https://gitlab.unige.ch/help/user/permissions> ).

To easy access management, you should think in a hierarchical terms from the very beginning:

1. create a *top-level* group with the least possible members (basically, only the administrators)
2. inside this group, create *sub-groups* or *projects* with specific permissions

Independently of the authentication source (SWITCHaai or SWITCH edu-ID), those users without a UNIGE mail address will automatically get an **external** account (see <https://gitlab.unige.ch/help/user/permissions#external-users-permissions> ), which means that:

1. they can not create groups or projects
2. read access to private or internal projects must be explicitly granted
3. read access to public projects is permitted

4. write access to any project must be explicitly granted

## Resources

By default, the following settings apply to any *internal* users:

1. maximum number of projects: 20
2. maximum size of a single project: 100MB
3. maximum size of an attachment: 10MB
4. maximum size of a single git push : 1MB

Please contact the GitLab UNIGE administrators (see <https://catalogue-si.unige.ch/gitlab> ) if you need more resources.

## Project visibility

By default, each project is **private** , *i.e.* they can only be cloned and viewed by project members.

For more details, please check the [corresponding section](#) of the upstream documentation of the UNIGE GitLab running instance.
